# App behavioral analysis using system calls

# Problem statement

We present Heimdall, a framework for studying system calls made by mobile apps in order to determine an app's behavior class and match such behavior to their stated purpose.

# Motivation: App issues

6 December 2013 Last updated at 06:42 ET

## Data haul by Android Flashlight app 'deceives' millions

The "brightest flashlight" app was downloaded to millions of Android devices

**Tens of millions of Android users have been "deceived" by a developer who covertly gathered personal data, the US Federal Trade Commission (FTC) said.**

Relat

# Motivation: Permission inadequacy

Pre-Marshmallow

Marshmallow

# Motivation: Software Limitation

Do you read privacy policies and do you understand them?

According to the [Internet Society's Global Internet User Survey](#), only 16% of internet users read privacy policies. Of those who do, only 20% actually understand them. Reading policies and

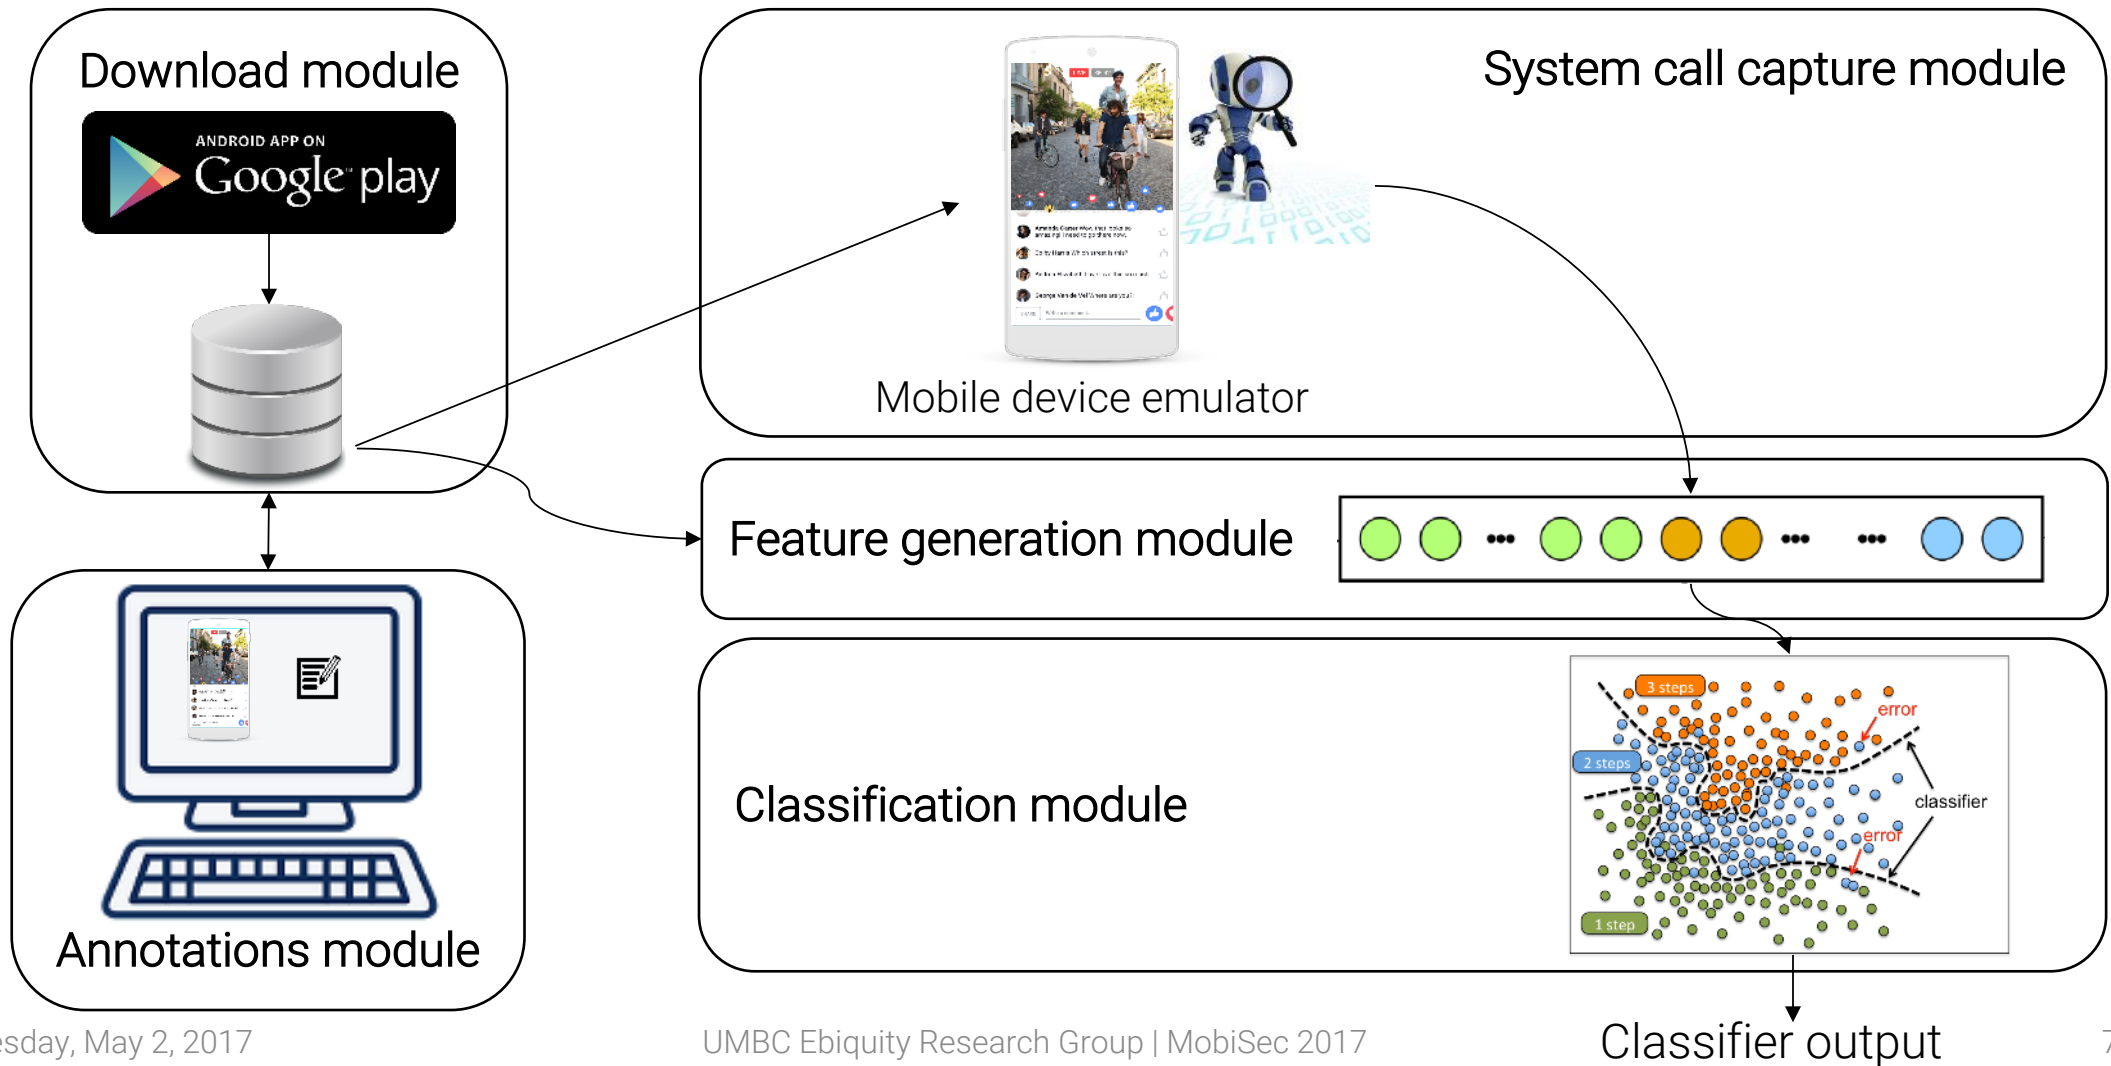

to be aware of. Generally speaking, even when there's something bad, I can't say I wouldn't have agreed to it begrudgingly anyway. Policies for software and webapps are a series of written terms. You don't get to negotiate and you have no actual ability to change anything you don't agree with. Unless I want to find out about a specific issue, I rarely read through policies because I can pretty accurately assume the worst in most cases. That isn't a fun thought, but there isn't a whole lot else to be done.

Annotated class distribution

Google categories distribution

# Experimental setup

- 1560 apps
- 534 successfully executed

- Android 6.0.1 December 2015 build used
- SVM, MLP, J48 and NB used
- Best F1-score from MLP at 0.44

- **strace** can only be used on emulator
- UI/Application exerciser tool used

```
open("/var/log/cups/page_log", 0_RDWR|0_CREAT|0_APPEND, 0666) = 6

Similar TF-IDF scores - Scientific calculator vs To-do list

# Results: Google categories

- Google's categories are developer provided
- Could be misleading
- System calls could classify behavior better
- Additional features required

# Results: Annotated classes

- System calls not *totally* useless
- 1-hot vs TF-IDF

Classifier	TF-IDF	1-hot
MLP	0.44	0.26
SVM-Poly	0.31	0.23
SVM-RBF	0.32	0.21
J48	0.27	0.31
NB	0.27	0.27

# Challenges faced

- Annotating app behavior class
- Emulator instabilities
- App limitations/bugs
- User credentials required
- Multi-behavior apps

# Conclusions

*Can system calls be used to distinguish between how an app “behaves” and it’s perceived/stated purpose?*

- System calls – insufficient as features
- Emulator – better ones required
- Coarser behavior classes required

# Future work

- System call bi-grams, tri-grams – for capturing call sequences
- Better emulator – Genymotion
- Malware classification – less scope (state-of-the-art is 96.7%)
- Generating contextual policies from behavior estimation
- Features planned for future:
  - App descriptions
  - App ratings
  - PHA app analysis – require samples for Mobile Unwanted Software
